ABOUT ME

I am a master's student and a Software Engineering graduate. I have experience building web applications with C#/.NET and Angular developing REST APIs, business logic, and frontend features. I work with a layered architecture (controller-service-repository) and focus on clean, maintainable code and high-quality releases. Additionally, I continue to grow my skills in React by building website projects.

SKILLS & ABILITIES

AI & LLM:

- LLM integration
- AI-powered chatbot development
- backend orchestration for AI services
- basic AI agent workflows

Backend & Architecture

- C# • .NET • ASP.NET Core • LINQ
- REST API design (Swagger/OpenAPI) • JWT
- Entity Framework • ASP.NET Identity
- Layered architecture • CQRS (MediatR)

Frontend

- Angular • React • Typescript • JavaScript
- HTML • CSS • Tailwind

Database & Tools

- SQL (MS SQL, MySQL) • Git • Jenkins
- Docker

Engineering Practices

- Clean code & separation of concerns
- Validation (FluentValidation)
- Logging & error handling
- Background processing
- Email notifications
- Token-based workflows

Languages

- Polish (Native)
- English (Advanced)

EXPERIENCE

MIKROBIT | July 2024 - December 2025 |

Backend Developer → Full-stack Developer (from April 2025)

- Took over an existing project from a senior developer and managed its development, maintenance, and releases independently, ensuring smooth project continuation and reliable delivery for clients.
- Designed and developed REST APIs in ASP.NET Core using a layered Controller-Service-Repository architecture, improving code maintainability, testability, and separation of concerns.
- Implemented an internal AI/LLM integration for a customer-facing chatbot using Ollama, building a backend communication layer between the frontend and the model API, which enabled the application to provide AI-powered customer support while keeping the LLM service isolated from direct client-side access.
- Built an integration between an external mobile application and the web platform, including secure auto-login, user management, and notification features, which enabled the organization to extend its services to mobile users.
- Implemented JWT and ASP.NET Identity based authentication and authorization, strengthening system security and providing a unified mechanism for user access management.
- Optimized SQL-based data access and implemented data mapping with Entity Framework and LINQ, improving backend reliability and supporting efficient data processing for application views and reports.
- Delivered full-stack features in Angular and ASP.NET Core, covering UI components, forms, dialogs, API integration, and backend logic, which shortened the development flow for complete business features.
- Added reusable pagination, filtering, and sorting mechanisms, improving user experience when working with larger datasets and making module behaviour more consistent.
- Prepared production-ready builds and client releases using Jenkins, contributing to more organized and repeatable release processes.
- Supported development of a parallel backend project based on CQRS with MediatR, helping structure business logic in a more scalable and maintainable way.

PROJECTS

- **Brothers Import** - company website for a business importing cars from the US (React, Tailwind CSS):
 - brothersimport.pl
- **VoltValue** - web app for searching photovoltaic component offers (React, Tailwind CSS):
 - voltvalue.pl

EDUCATION

LUBLIN UNIVERSITY OF TECHNOLOGY

Faculty of Electrical Engineering and Computer Science.

Major: Computer Science

- **M.Sc. studies** | October 2024 - Present
- **B.Eng. studies** | October 2020 - February 2024
